## ABSTRACT

The problem of investigating consistent interactions that can be added to a set of scalar fields, two collections of one-forms and a system of two-forms, described in the free limit by a sum of abelian BF models, is reported. The couplings of this class of BF models to matter fields and vector fields are also discussed.

[*] Invited lecture, presented at the IVth International School and Workshop on QFT and Hamiltonian Systems, 16-21 October 2004, Calimanesti, Romania.
